Greetings! I am Dmitry.

A few words about me…

Education. Born in Ukraine in the city of Kharkov. Graduated from high school in the same city. He studied at the National Aerospace University (KhAI) with a degree in: "Radio engineering devices, systems and complexes." In 2002 he defended his diploma for a Bachelor's degree, and in 2003 for a Specialist's degree (Theme of work: "Development of voice signal compression algorithms in DECT and GSM900/1800 mobile communication systems"). In 2006 graduated from the courses of managers.

Profession. For the last twenty years, my main activity has been everything related to engineering. I went all the way from an employee to the chief engineer of the enterprise. Worked in companies and as a freelancer. Learned to make quick decisions without the right to make mistakes. After 2015, as a freelance engineering communications consultant, dealt with issues related to the smooth operation of all engineering systems of the enterprise, as well as communication with contractors (task setting, search and selection, control of execution and acceptance of work performed). As the chief engineer of the enterprise, my duties included the functions of planning and organizing the work of the technical department, as well as the selection, motivation and control of the work of employees. Using in their work software products and knowledge of Time Management in combination with the Kanban methodology, all processes were automated as much as possible.

Hobby.   I like to study and apply new technologies in practice in my work. In addition, I like to create something new, something that is not there yet. Therefore, all my hobbies, one way or another, arose from ordinary curiosity, which requires constant learning.

Self-education. This is where books play an important role in my life. When there is no time to read, audiobooks come to the rescue. Access to video courses and trainings on the Internet allows you to build knowledge on your own. For example, when learning a foreign language.

Computer programs. Since 2002, in my professional activity and hobby, I have been using various tools. To create a design for printing and packaging - CorelDraw и Photoshop; for industrial design and prototyping - Blender, ArtCam; sometimes Pepakura; for writing instructions, books and articles - text editors.

Programming.   Several times in my life I faced the need to be able to program. Computer languages with which I had to work (or learn) in different periods of my life: Basic, Fortran, Pascal, FunctionBlockDiagram, Python.

Front-end.   Because the development of the visible part of the site combines both programming and design. How to do it with a HTML, CSS and SCSS/SASS - now i know. Front-end technology study started in October 2022. My works created in this direction are presented in the portfolio. In now – study JawaScript, jQuery.

Target.   My goal – so that the creation of websites was not just a hobby, but turned into a profession. I have already managed to make a full-fledged professional career in an industry that requires a high level of responsibility, composure and knowledge. Over the next ten years, I want to take a new path in creating websites and online applications...

Now. There is a need for practice on real projects. That's why I'm interested in employment in company, in which there is an opportunity to grow from an intern to a mid-level specialist and above. Remotely a job title. Now, all my free time is spent studying JawaScript and practice HTML и CSS. My technique self-education: 1. Example video or short introductory lecture; 2. Video lesson analysis and identification of unclear points; 3. Modern textbook -> lecture notes; 4. Practice, practice and again practice; 5. Repetition of the main points according to the abstract, after 7, 20, 100 days.

More information and **portfolio** in my page github.

With respect and hope that I can be a useful specialist for you.

Dmitry Mikhailovich.
